climate change threatens to destroy gains made in poverty reduction in many developing countries substantial funding will be needed to help poor countries tackle climate change this funding must be additional to pledges already made for development assistance because developing countries are not responsible for the emissions which have caused climate change and the estimated costs cannot be met from existing development assistance or national budgets the current economic crisis could derail efforts to tackle climate change or it could provide an

opportunity to chart a new greener growth strategy in developing climate change should be central to the department for international development s dfid s work in developing countries and it needs to start establishing comprehensive climate change programmes sustainable management of the natural resource base is vital dfid has focussed on water resources management and it should now consider the creation of marine and forestry management strategies to ensure that these sectors can continue to contribute to economic growth in a sustainable manner developed countries should ensure that actions taken to reduce emissions do not impact negatively on developing countries tourism and export horticulture are important contributors to poverty reduction in many poor countries and these sectors should be supported to increase their pro poor benefits and reduce their climate change impact there is a need for more research into low carbon options which are appropriate for poor countries and for mechanisms to facilitate knowledge and technology transfer the copenhagen conference to decide the successor to the kyoto agreement must agree stringent emission reduction targets or increase the risk of more severe climate change impacts

echinoderms are an ancient and diverse group of marine animals with a rich fossil record they occur abundantly in all modern oceans and at all depths where they contribute importantly to patterns in biodiversity and to the structure and functioning of marine systems it is therefore vital to understand how they will respond to a rapidly changing environment

global climate change affects productivity and species composition of freshwater and marine aquatic ecosystems by raising temperatures ocean acidification excessive solar uv and visible radiation effects on bacterioplankton and viruses phytoplankton and macroalgae have farreaching consequences for primary consumers such as zooplankton invertebrates and vertebrates as well as on human consumption of fish crustaceans and mollusks it has affected the habitation of the arctic and antarctic oceans the most so far increasing pollution from terrestrial runoff industrial municipal and household wastes as well as marine transportation and plastic debris also affect aquatic ecosystems

provides unique synthesis of various modeling methodologies used to aid planning and operational decision making for academic researchers and professionals
